

ABSTRACT

A system for handling folded sheet material, including a rotatable clamping device including a linearly displaceable clamping component, and a collecting device shaped substantially as a saddle, where the rotatable clamping device is configured to simultaneously encompass opposing sides of the collecting device.

1. A system for handling folded sheet material, comprising:
a. a rotatable clamping device including a linearly displaceable clamping component;
b. a collecting device shaped substantially as a saddle;
c. the rotatable clamping device configured to simultaneously encompass opposing sides of the collecting device.
